WarGames operational milestone map

Use a recorded result to choose the next action. Keep unchecked work marked pending.

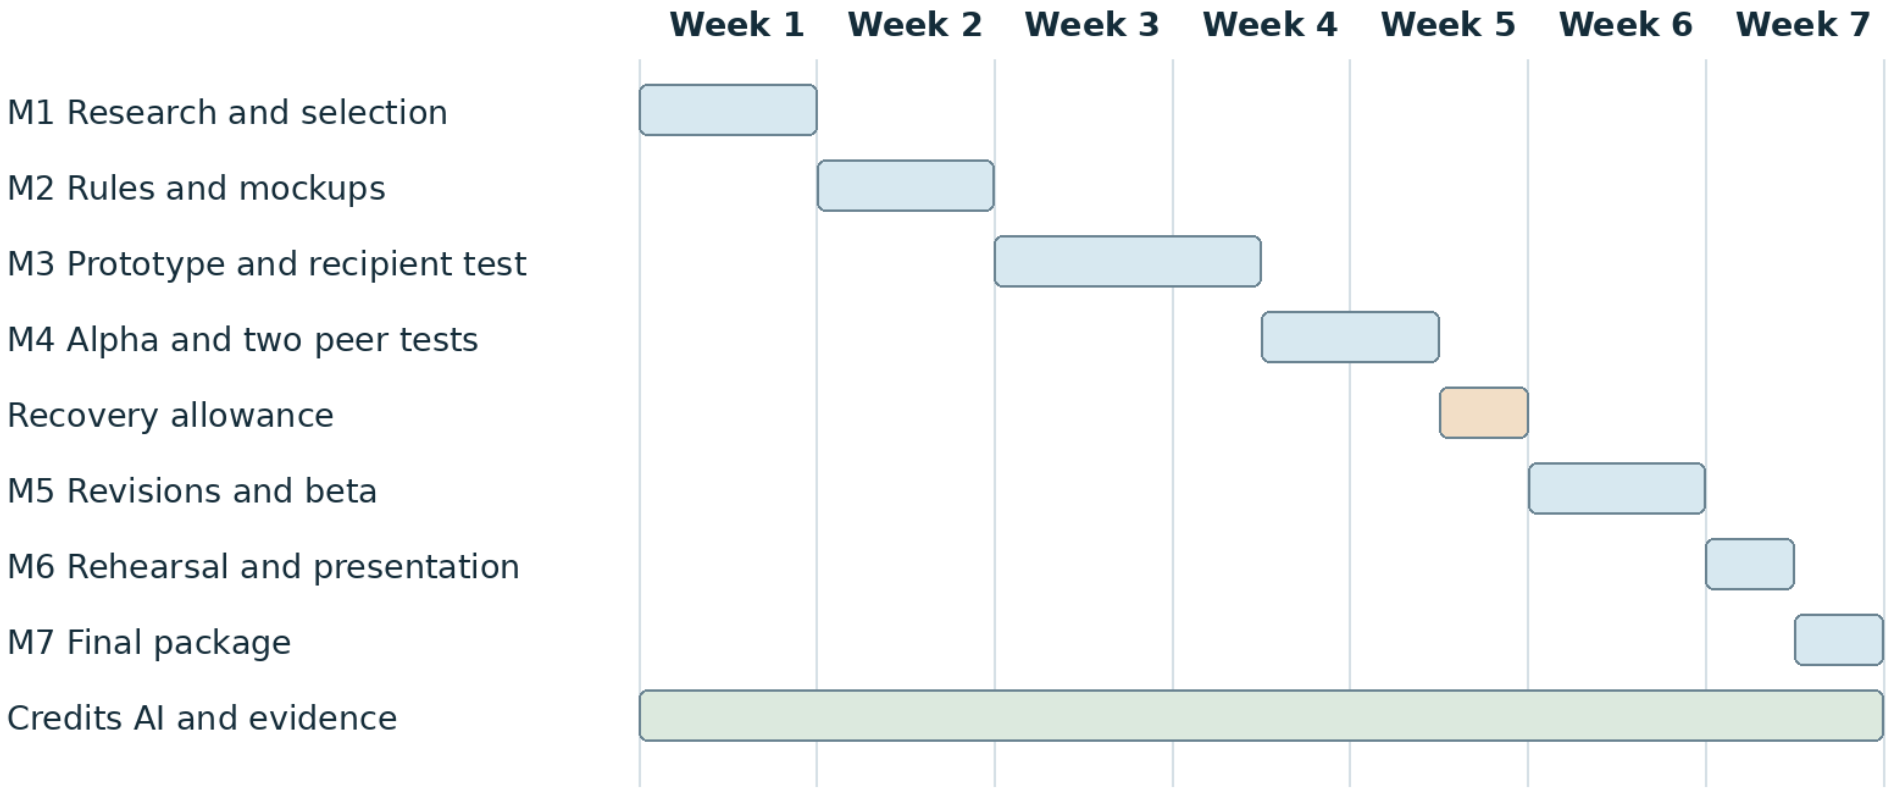

PERFORM SAVE AND CHECK	IF THE CHECK FAILS
M1 Compare concepts and choose one Save three paragraphs, a rationale and an interface sketch. Check: both partners trace the selected interaction.	No → **No selection or missing action** Rewrite the concept or sketch; repeat the trace.
Yes ↓	
M2 Specify the program rules Save brief, state flow, asset list and both mockups. Check: both partners record the same paper-run outputs.	No → **Conflicting conditions or missing state** Correct the transition rule; repeat the affected trace.
Yes ↓	
M3 Build and test the recipient copy Save working ZIP and a report of at least two pages. Check: extract, launch, use controls and reach an outcome.	No → **Wrong behavior or failed recipient launch** Repair the code or package; repeat affected checks.
Yes ↓	
M4 Complete alpha and observe two peers Save alpha, two genuine peer notes and three priorities. Check: full route runs and both peer records exist.	No → **Blocked route or missing peer note** Repair the route or run the missing peer session.
Yes ↓	
M5 Revise and check the beta Save beta, title, designer statement and four screenshots. Check: replay revised tasks and the complete route.	No → **A revision fails or breaks another state** Repair, simplify or restore; repeat the affected task.
Yes ↓	
M6 Rehearse and present the selected build Save build, slide or one-page summary and self-assessment. Check: each partner runs the demo and traces an input.	No → **Failed launch, demo step or code trace** Repair or restore the copy; rehearse the same route.
Yes ↓	
M7 Reconcile and submit final files Save source, build, 300-500 words, images and full records. Check: launch the final copy and match every claim.	No → **Missing item or mismatch with the build** Correct the specific item; repeat its check and upload.

The checker advances after the required evidence passes. For a failed check, follow the repair arrow and repeat the affected operation. If a repair changes a core rule, revise the M2 plan before changing the implementation. Preserve every required deliverable when cutting optional work.

Sources: supplied WarGames brief, milestone instructions and pathway framework. All project completion remains unrecorded.

WarGames relative week Gantt

Allocate seven illustrative weeks. Replace this estimate with available sessions and corrected course deadlines.

Use elapsed planning windows. Move dependent work when a required check remains pending.

Move the recovery allowance earlier if needed; no bar end certifies milestone completion.

Arrange peer availability during planning; collect the two actual notes on the alpha. Keep credits, AI records and progress evidence inside the same two-person work allocation. Begin presentation and final packaging with the records already collected.

At a failed check, move the recovery allowance to that work. Shift dependent milestones if the repair takes longer. Record real progress separately from this schedule; a completed time window does not complete a required task.
